Scientific document translation - page 1

1. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

2. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

3. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

4. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

5. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

6. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

7. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

8. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

9. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

10. Scientific experiments compare a baseline method with a bounded resource policy. Every observation records the input, effective configuration and measured result. Repeated trials distinguish startup overhead from steady operation. Mathematical notation and paragraph order must survive translation, while output files retain their identity.

$$E = m c^2 ; sigma^2 = E[(X-mu)^2]$$
